

1 Specify inputs

Pilot, target, geometry
Density and pose classes
Noise model

2 Choose weights

Continuous weights w
Conservative objective
Primal–dual gap

3 Audit bounds

Continuous bias b
Integration / spectral bounds
Noise SD (or upper bound) s

4 Apply to particles

Inference particles y
 $\hat{t} \pm q(s, b, \alpha)$
No-data fallback when wider

Required: independent design, valid noise assumptions and membership in the stated classes.
